Mathematics Worksheet
Photosynthesis

Subject: Science **Class:** Class 5 **Total Marks:** 30 **Time:** 45 min

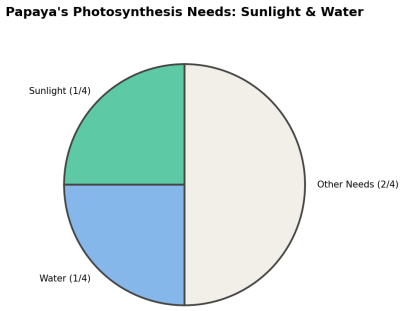
School: _____ **Name:** _____ **Date:** _____

Instructions
- Answer all 8 questions.
- Calculators are **not** permitted.
- Show all working steps.

Section A — Easy (2 marks each)

Q1. Rahim planted a small papaya sapling in his backyard in Bogura. Every morning, he waters it carefully and it sits under the bright morning sun. What two important things does the papaya sapling get from its surroundings that help it make its own food?

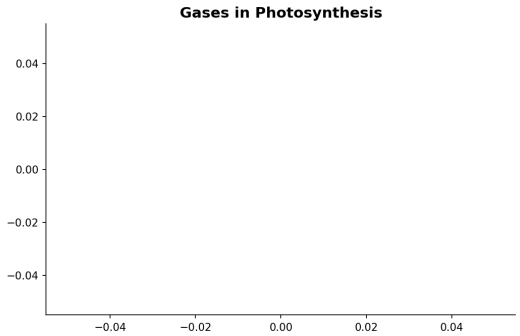
[2 marks]

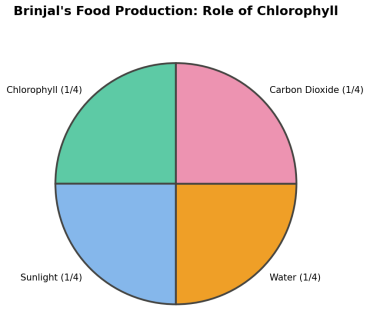


Write your answer below:

Q2. Fatema's mother explained that their brinjal plants in Comilla grew big and healthy because they made their own food inside their green leaves. What is the name of the process by which these plants make their food, and what gives their leaves the green color essential for this process?

[2 marks]

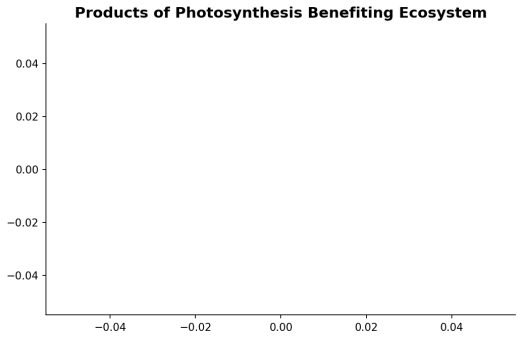


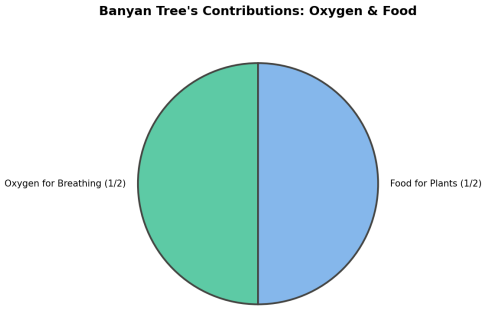


Write your answer below:

Q3. Rima and her younger brother love to play under the shade of the big banyan tree by the pond in their village in Barisal. They always feel the air is fresher there. What essential gas do the banyan tree and other plants release into the air that makes it feel fresher and that all living things need to breathe?

[2 marks]



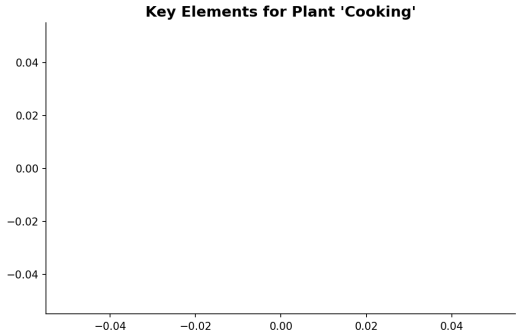


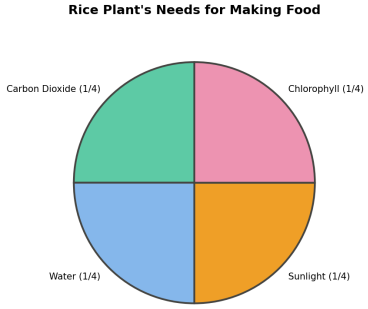
Write your answer below:

Section B — Medium (4 marks each)

Q4. Karim's father explained that the green rice plants in Mymensingh take water from the field and something invisible from the air, along with sunlight, to create rice grains. What are these two essential things that rice plants take from the air and the ground, and what is the green substance in their leaves called, all necessary for making rice?

[4 marks]

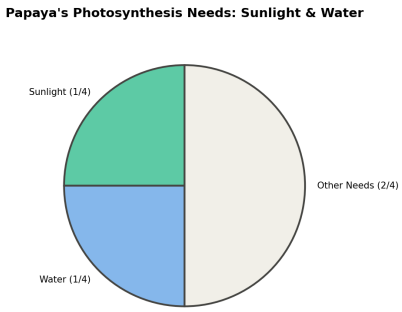




Write your answer below:

Q5. Rahim waters his papaya sapling in Bogura every morning, and it sits under the bright sun. Explain why both watering the plant and ensuring it gets sunlight are important for the sapling to produce its own food.

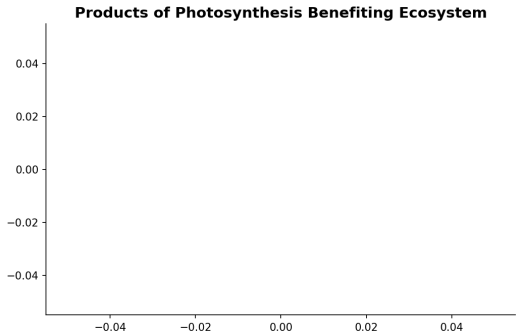
[4 marks]

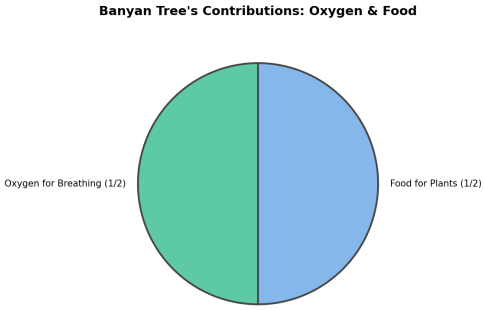


Write your answer below:

Q6. Rima and her brother feel the air is fresher and cooler under the big banyan tree in Barisal, and a cow grazes peacefully nearby. Explain why plants like the banyan tree make the air feel fresher and are so important for living things like humans and cows.

[4 marks]



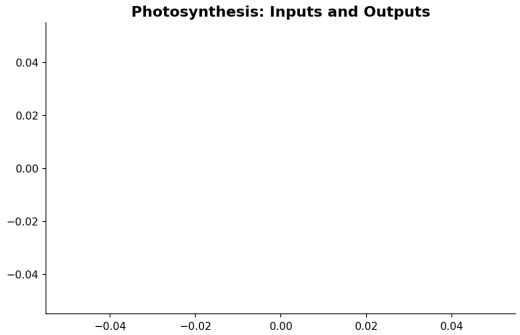


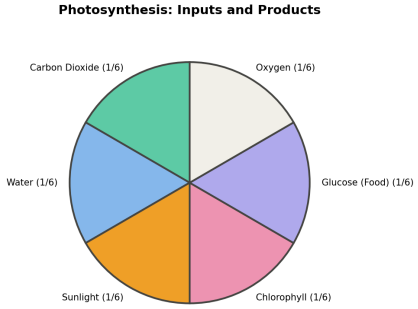
Write your answer below:

Section C — Hard (6 marks each)

Q7. Nabil has banana, mango, and jute plants in his garden in Narayanganj, all with green leaves. He knows they need water, sunlight, and a gas from the air to make their own food. While making food, they also release a gas that helps humans and animals survive. Name the four essential components Nabil's plants need to make their food, and the two important products they create during this process.

[6 marks]

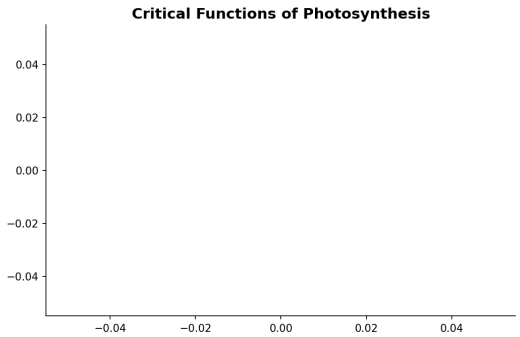


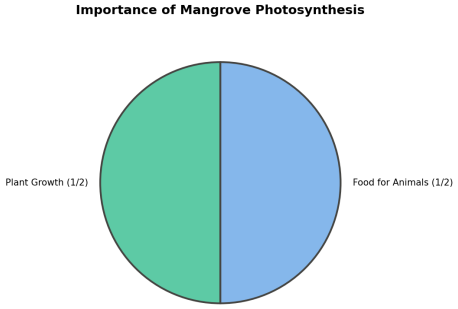


Write your answer below:

Q8. Masud saw towering mangrove trees with rich green leaves in the Sundarbans. His guide explained that these trees make their own food, which helps them grow tall and strong, creating a habitat for many animals, like the deer. Explain how the mangrove trees grow tall and strong, and why this process is not only important for the trees themselves but also for animals like the deer in the Sundarbans.

[6 marks]





Write your answer below:

Answer Key

Q1. Answer: Sunlight and Water.

Step 1: Step 1: The scenario mentions the sapling gets 'bright morning sun' and Rahim 'waters it carefully'.
Step 2: Step 2: These two elements, sunlight and water, are essential for plants to make their own food through photosynthesis.

Q2. Answer: The process is Photosynthesis (■■■■■■■■■■■■■■), and the green substance is Chlorophyll (■■■■■■■■■■).

Step 1: Step 1: The process by which plants make their own food is called Photosynthesis.
Step 2: Step 2: The green color in plant leaves is due to a substance called Chlorophyll, which is crucial for capturing sunlight during photosynthesis.

Q3. Answer: Oxygen (■■■■■■■■■).

Step 1: Step 1: Plants perform photosynthesis, taking in carbon dioxide and releasing another gas.
Step 2: Step 2: The gas released that is vital for living things to breathe and makes the air feel fresher is Oxygen.

Q4. Answer: The invisible thing from the air is Carbon dioxide (■■■■■■■ ■■■ ■■■■■■■■). The thing from the ground is Water. The green substance in their leaves is Chlorophyll (■■■■■■■■■■).

Step 1: Step 1: Plants absorb water from the ground (soil) through their roots.
Step 2: Step 2: Plants take an invisible gas called carbon dioxide from the air.
Step 3: Step 3: The green pigment in their leaves, called chlorophyll, is responsible for capturing sunlight, which is also needed for the process.

Q5. Answer: Water and sunlight are two essential components for photosynthesis. Plants absorb water from the soil and use the energy from sunlight, along with carbon dioxide, to produce their own food (glucose) and grow.

Step 1: Step 1: Plants need raw materials and energy to make food.
Step 2: Step 2: Water is absorbed by the roots from the soil and is a necessary raw material for photosynthesis.
Step 3: Step 3: Sunlight provides the energy required for the chemical reaction of photosynthesis, converting carbon dioxide and water into food.

Q6. Answer: Plants like the banyan tree perform photosynthesis, a process where they take in carbon dioxide and release oxygen into the air. This oxygen is vital for humans and animals (like the cow) to breathe and survive, thus making the air feel 'fresher' and supporting all life.

Step 1: Step 1: Plants conduct photosynthesis, absorbing carbon dioxide from the air.
Step 2: Step 2: During this process, they release oxygen as a byproduct.
Step 3: Step 3: Oxygen is the gas that humans and animals need to breathe for their survival, which contributes to fresher air.

Q7. Answer: The four essential components Nabil's plants need are: Carbon dioxide, Water, Sunlight, and Chlorophyll. The two important products they create are: Glucose (food) and Oxygen.

Step 1: Step 1: Identify the inputs needed for photosynthesis: 'a gas from the air' is carbon dioxide, 'water', 'sunlight', and 'green leaves' imply chlorophyll.
Step 2: Step 2: Identify the outputs of photosynthesis: 'make their own food' is glucose, and 'release a gas that helps humans and animals survive' is oxygen.

Q8. Answer: Mangrove trees grow tall and strong by performing photosynthesis. In this process, they use sunlight, water, carbon dioxide (from the air), and chlorophyll (in their green leaves) to produce their own food (glucose). This food provides the energy and building blocks for the trees to grow. This process is crucial not only for the trees because the food they make sustains their life and growth, but also for animals like the deer. The deer eat the leaves and twigs of these mangrove trees, obtaining the energy and nutrients from the food the trees produced. Without photosynthesis by the mangrove trees, the deer would not have a food source and could not survive, highlighting its importance for the entire Sundarbans ecosystem.

Step 1: Step 1: Explain how plants grow tall and strong: by making their own food through photosynthesis using sunlight, water, carbon dioxide, and chlorophyll.

Step 2: Step 2: Explain the importance for the plants themselves: the food provides energy for their growth and survival.
Step 3: Step 3: Explain the importance for other living organisms (like deer): animals eat plants to get the energy and nutrients from the food produced by photosynthesis, thus forming the base of the food chain.
